NASA/TP-2002-211556

NASA Glenn Coefficients for Calculating Thermodynamic Properties of Individual Species

Bonnie J. McBride, Michael J. Zehe, and Sanford Gordon Glenn Research Center, Cleveland, Ohio Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the Lead Center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- TECHNICAL PUBLICATION. Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA's counterpart of peerreviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- TECHNICAL MEMORANDUM. Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- CONTRACTOR REPORT. Scientific and technical findings by NASA-sponsored contractors and grantees.

- CONFERENCE PUBLICATION. Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.
- SPECIAL PUBLICATION. Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- TECHNICAL TRANSLATION. Englishlanguage translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

NASA Glenn Coefficients for Calculating Thermodynamic Properties of Individual Species

Bonnie J. McBride, Michael J. Zehe, and Sanford Gordon National Aeronautics and Space Administration Glenn Research Center Cleveland, Ohio 44135

Summary

This report documents the library of thermodynamic data used with the NASA Glenn computer program CEA (Chemical Equilibrium with Applications). This library, containing data for over 2000 solid, liquid, and gaseous chemical species for temperatures ranging from 200 to 20 000 K, is available for use with other computer codes as well. The data are expressed as least-squares coefficients to a seven-term functional form for $C_p^o(T)/R$ with integration constants for $H^o(T)/RT$ and $S^o(T)/R$. The NASA Glenn computer program PAC (Properties and Coefficients) was used to calculate thermodynamic functions and to generate the least-squares coefficients. PAC input was taken from a variety of sources. A complete listing of the database is given along with a summary of thermodynamic properties at 0 and 298.15 K.

Introduction

Thermodynamic data for individual species are required in many applications involving chemical reactions. For over 50 years the NASA Lewis (now Glenn) Research Center has been compiling and disseminating thermodynamic data for use in its chemical equilibrium programs. These data, widely used by the thermodynamic community, have grown from 42 species to the current 2000.

For calculation purposes, the use of thermodynamic data in the form of simple empirical equations has some obvious advantages. First, it makes tabular interpolations unnecessary; second, it permits analytical integrations; and, third, it condenses all the tabulated information into a few constants that accurately reproduce the many thermodynamic data points.

Earlier versions of the NASA Lewis chemical equilibrium computer programs (Gordon et al., 1971, Svehla et al., 1973, Gordon et al., 1976, Gordon et al., 1984,

Gordon et al., 1988, and McBride et al., 1994) used a fourth-order polynomial as an empirical representation of $C_p^o(T)/R$ over a temperature range of 300 to 5000 K. The final library of data using this form contained 1130 species documented in NASA TM-4513 (McBride et al., 1993b). For the data in the current report, two terms involving T^{-1} and T^{-2} were added for more accuracy over wider temperature ranges.

A new format was selected that would not only accommodate these two new constants but also allow for revisions and expansions in the future. Features of the new format and how they were used in this report are as follows:

- (1) Up to eight constants can be used in the empirical equation for $C_p^o(T)/R$. Only seven were used for the data reported here.
- (2) Variable temperature intervals can be used. This new feature was helpful in obtaining good fits for condensed species, which often have irregularly shaped curves and variable transition points. However, standard temperature intervals were used for gases. With a few exceptions, fixed intervals fit the thermodynamic functions for gases accurately.
 - (3) There is space for comments and references.
- (4) The chemical formula may now contain up to five unique atoms. The previous format allowed for only four atoms.
- (5) Variable and noninteger temperature exponents are now permitted in the empirical equation for $C_p^o(T)/R$. We used the exponents -2, -1, 0, 1, 2, 3, and 4.
- (6) The new format is easier to read. For convenience, values are also given for the molecular weight, heat of formation, and $H^o(298.15) H^o(0)$.

All symbols used in this report are listed and defined in appendix A. Appendix B contains tables summarizing the thermodynamic data at 0 and 298.15 K. Appendix C gives a description of the particular format used for the database, and appendix D is a complete listing of the NASA Glenn coefficient data as of the date of this report.

The data for individual species are updated as new measurements and estimates appear in the literature. The database is distributed freely via a request form on the internet at http://www.grc.nasa.gov/WWW/CEAWeb/.

Standard States, Reference States, and Fundamental Constants

The symbols and definitions follow the recommendations of Cox (1982). All data in this report are for species in their standard state at the specified temperature. For gases, this is the ideal gas at the standard pressure, 1 bar. For condensed species, the standard state is the pure crystalline or liquid substance at the standard pressure, 1 atm. All thermodynamic properties are molar quantities.

In order for heats of formation to be unambiguously related to specific reactions, a set of reference states must be specified for the chemical elements. The reference state of the elements is generally taken to be the thermodynamically stable state at 298.15 K. For those elements which are gases at 298.15 K and 1 bar, the reference state is taken as gaseous over the entire temperature range. For species that are condensed at 298.15 K, the entire range is taken to be condensed with transitions between various phases. In appendix D, these reference species have either 'Ref-elm' or 'Ref-species' following their name.

Fundamental constants were taken from Cohen et al. (1987). The values used for the molar gas constant R, the Sackur-Tetrode constant S_o/R , the second radiation constant c_2 , and the electron mass m_e are given in the symbol list in appendix A. Some thermodynamic functions taken from the literature were calculated using values of R and Sackur-Tetrode constants different from those selected for this report. In these cases, corrections were made to the thermodynamic functions to adjust for the differences. Corrections were made to entropy and Gibbs energy values that had been previously calculated using 1 atm for the standard state pressure rather than 1 bar.

The atomic weights were taken from Coplen (1996). These weights are given in atomic mass units, u, based on ${}^{12}C = 12$ u.

Empirical Equations for Fitting Thermodynamic Functions

Thermodynamic data for many individual species can be conveniently stored for use with computer programs in the form of coefficients associated with equations that reproduce the data. The following dimensionless form was chosen for this report:

$$\begin{split} C_p^o(T)/R &= a_1 T^{-2} + a_2 T^{-1} + a_3 + a_4 T \\ &\quad + a_5 T^2 + a_6 T^3 + a_7 T^4 \ \, (1) \end{split}$$

Enthalpy and entropy are obtained by integrating $C_p^o(T)$ and $C_p^o(T)/T$, respectively, with respect to T:

$$H^{o}(T)/RT = -a_{1}T^{-2} + a_{2}lnT/T + a_{3} + a_{4}T/2$$

$$+ a_{5}T^{2}/3 + a_{6}T^{3}/4 + a_{7}T^{4}/5 + b_{1}/T$$
 (2)

$$\begin{split} S^o(T)/R &= -a_1 T^{-2}/2 - a_2 T^{-1} + a_3 ln T + a_4 T \\ &+ a_5 T^2/2 + a_6 T^3/3 + a_7 T^4/4 + b_2 \quad (3) \end{split}$$

where b_1 and b_2 are integration constants. These equations have been found to accurately reproduce the thermodynamic quantities over a wide temperature range.

Assigned Enthalpy Values

For each species, heats of formation (and, when applicable, heats of transition) were combined with sensible heats, $H^o(T) - H^o(298.15)$, to give the assigned enthalpies, $H^o(T)$. By definition

$$H^{o}(T) \equiv H^{o}(298.15) + [H^{o}(T) - H^{o}(298.15)]$$
 (4)

We arbitrarily assign $H^o(298.15) = \Delta_f H^o(298.15)$. The above equation then becomes

$$H^{o}(T) = \Delta_{f} H^{o}(298.15) + [H^{o}(T) - H^{o}(298.15)]$$
 (5)

In general, $H^o(T)$ will not equal $\Delta_f H^o(T)$ except at 298.15 K. Similarly, for the $H^o(0)$ values listed in tables B1 and B2 in appendix B,

$$H^o(0) = \Delta_f H^o(298.15) - [H^o(298.15) - H^o(0)] \qquad (6)$$

All reference elements and the reference species electron gas have assigned enthalpy values, $H^{o}(298.15)$, equal to zero.

Assigned enthalpies for reactants are listed in table B3 in appendix B. For noncryogenic reactants, assigned enthalpies are given at 298.15 K. For cryogenic liquids, assigned enthalpies are given at their boiling points

instead of 298.15 K. These are obtained by subtracting the following values from the heat of formation of the gas at 298.15 K: (1) the sensible heat of the ideal gas at 298.15 K relative to the boiling point, (2) the relative enthalpy of the ideal gas to the real gas at the boiling point, and (3) the heat of vaporization at the boiling point.

Heats of Formation and Equilibrium Constants

At any temperature, values of $\Delta_f H^o$ and $\log_{10} K$ may be calculated for the formation of a species from its constituent elements in their assigned reference states. The following is an example of how these properties can be calculated for CO(g) at 1000 K:

$$\Delta_f H^o(1000) = H^o(1000) \text{ CO(g)}$$

$$- H^o(1000) \text{C(graphite)} - \frac{1}{2} H^o(1000) \text{ O}_2(g) \qquad (7)$$

$$\Delta_f G^o(1000) = G^o(1000) \text{ CO(g)}$$

$$-G^o(1000)\text{C(graphite)} - \frac{1}{2}G^o(1000) \text{ O}_2(g) \qquad (8)$$

By definition,

$$\log_{10} K = -\Delta_f G^o(T)/(2.3025851 \ RT) \tag{9}$$

Properties and Coefficients (PAC) Programs

The NASA Glenn computer program PAC99 was used to convert molecular constants and thermodynamic data into the coefficient form described in appendix C. PAC99 is the latest in a series of FORTRAN programs that generate data in the format required by CEA. It is an expanded version of PAC91 (McBride et al., 1992). The expansion includes new techniques for calculating properties for atomic species (Gordon et al., 1999), increased dimensions for larger molecules, and the capacity to use more parameters in internal rotor calculations. The following sections discuss the tasks performed by this program.

Thermodynamic Properties

Thermodynamic properties may be read in either as thermodynamic functions or as coefficients. A method for extrapolating these data to higher temperatures is provided. For gases, PAC99 provides several methods for calculating thermodynamic functions from molecular data.

The calculation methods used for monatomic gases are outlined in Gordon et al. (1999). For polyatomic species, six closed-form calculation methods are available (McBride et al., 1992). All were used in this report. All use a rigid-rotor harmonic-oscillator base with corrections for anharmonicities, vibration-rotation interactions, rotational stretching, low-temperature quantum rotation, Fermi and Darling-Dennison resonance, and internal rotation. The Darling-Dennison resonance and some lowtemperature quantum corrections (Gurvich et al., 1989) have been added since PAC91. The internal rotor calculations were also expanded to use more potential and rotational constants (Lewis et al., 1972, and Zeleznik, 2002). Equilibrium mixtures of isomers were calculated by summing the partition functions for each conformer. PAC99 calculates tables of thermodynamic functions including $\Delta_f H^o$ and $\log_{10} K$ with an option to do a least-squares fit of the data.

Least-Squares Fit

Most coefficients in equations (1) to (3) were obtained using the least-squares fit feature in PAC99. For gases, the temperature ranges for these fits are split into three fixed intervals: 200 to 1000 K (298.15 to 1000 K for ions), 1000 to 6000 K, and for some simple molecules, 6000 to 20 000 K. For condensed species, the temperature ranges are variable, with each phase having its own set of coefficients. The fits were subject to the following constraints:

- (1) An exact fit at 298.15 K.
- (2) Coefficients for two contiguous intervals yield the same functional values at the common point.
- (3) The difference in Gibbs energy is zero between condensed phases.
- (4) Generally $C_p^o(T)/R$, $[H^o(T)-H^o(0)]/RT$, and $S^o(T)$ were fit simultaneously as suggested by Zeleznik et al. (1961). However, this method was not used for monatomic species, where electronic levels were truncated with a temperature-dependent cutoff technique (Gordon et al., 1999). For these cases, the least-squares fit was on $C_p^o(T)/R$ only.

Generally for intervals where $C_p^o(T)/R$ is constant, a least-squares fit was not done.

Data Sources

Each species within the coefficient data file (app. D) contains abbreviated references to the data used to generate those coefficients. Complete reference citations, ordered by first author's last name and year, are listed at the end of this report.

Heats of formation were often obtained indirectly from other values (e.g., dissociation energies). This required the use of additional thermodynamic data. Generally, the supporting data were taken from the NASA database, otherwise the references are indicated.

For condensed species, either thermodynamic functions or fitted coefficients were taken directly from the references listed. For most gases the functions were calculated with the PAC99 program using molecular data from the cited references and any of several calculation techniques. However, for diatomic gases most of the functions were taken directly from the Gurvich references because they used a direct summation method not currently part of PAC99. If molecular constants for excited electronic states of diatomic and polyatomic gases were not available in the source reference, they were taken from another electronic state, usually the ground state.

Calculation techniques for monatomic species are described in Gordon et al. (1999). When thermodynamic functions for a gas were taken directly from the literature and were not given to high enough temperatures (e.g., 6000 or 20 000 K), they were extrapolated by the method described in Wilhoit (1975). Extrapolations were done in order to provide reasonable values outside the temperature range of the original data, which is important when CEA iterates on *T*. During the iteration, *T* may be temporarily out of range of the original data, resulting in thermodynamic properties so inaccurate that convergence is impossible.

Thermodynamic Properties at 0 and 298.15 K

A summary of the thermodynamic properties at 0 and 298.15 K is given in appendix B. There are three tables:

- Table B1.—Thermodynamic Properties for Gases at 0 and 298.15 K
- Table B2.—Thermodynamic Properties for Condensed Species at 0 and 298.15 K
- Table B3.—Assigned Enthalpies for Species That Are Used in CEA as Reactants Only

Note that reactants-only species with coefficients appear not only in table B3 but also in table B1 or B2. The thermodynamic quantities at 298.15 K were calculated from the coefficients. Since the least-squares fits are constrained to fit these values, the listed quantities match the source values. The third table lists assigned enthalpies and associated temperatures, molecular weights, and stoichiometric coefficients for species in the reactant-only class. No other thermodynamic quantities are listed in this table because coefficients are not available for most of the species.

Thermodynamic Coefficients Data

Appendix D lists the thermodynamic data as distributed in a file called thermo.inp. Appendix C discusses the format of this file. It shows the exact placement of names, references and comments, reference-date codes, chemical formula, molecular weights, heats of formation, $H^o(T) - H^o(0)$ values, temperature ranges, number of temperature intervals, phase code, and coefficients.

The following sections contain general comments on species names, data order, and miscellaneous information useful in interpreting the database. Each line of data is referred to as a record.

Species Names

The first 15 characters in the first record are reserved for the species name, usually the chemical formula. Longer names are often truncated. The letter "l," which is normally lowercase, has been replaced with uppercase "L" to avoid confusion with the number "1." Condensed phases designated as α , β , γ , or δ are called a, b, c, or d because FORTRAN does not allow Greek letters. Similarly, numbers normally shown as subscripts are printed on the main line for the same reason.

References

References and comments follow the species name in record 1. References are usually depicted by the first author's last name and the year of publication. An exception is for the TRC (Thermodynamic Research Center) looseleaf tables, where page and table date are used. Comments are abbreviated to fit the space available. When the heat of formation is taken from a separate reference, it is indicated as "Hf:". Reference elements

or reference species used for heats of formation are indicated by "Ref-Elm." or "Ref-Species."

Species Order

The data are divided into three categories and are listed in the following order:

- (1) Gases used in CEA as possible products and reactants (pp. 45–210)
- (2) Condensed species used in CEA as possible products and reactants (pp. 210–276)
- (3) Species that may be used only as reactants in CEA (e.g., air or Jet-A) (pp. 276–280)

Within the first two categories, the species are listed alphabetically according to the chemical formula given on the second record. The reactants-only set is listed alphabetically by name. This set is separated from the first two by a single record "END PRODUCTS" (see p. 276).

For condensed species with multiple phases, individual phases are listed in increasing order according to their temperature ranges. Consecutive phases are numbered consecutively starting with "1" in column 52 in record 2. See appendix C.

Reference-Date Codes

Record 2 contains a six-character code designating a reference and date as defined at the beginning of appendix D. The alphabetic part of the code represents a large compilation of data (e.g., "j" for JANAF or "g" for Glenn Research Center). The "g" was used if the PAC99 input data either (1) came from mixed sources, (2) came from a source not coded, (3) were molecular constants where no thermodynamic functions were given in the source, or (4) were molecular constants with a calculation method differing from the method used by the source.

Temperature Ranges

For nonionic gases, the temperature range of the fitted data is either 200 to 6000 K, or 200 to 20 000 K. For ionic gases, the starting temperature is 298.15 K. Only the electron gas, monatomic species, and simple molecules (e.g., CO, CO₂, N₂, NO, and O⁺) have been fitted to 20 000 K. For gases, there is a breakpoint in the fit at

1000 K. For gases fitted to 20 000 K, there is an additional breakpoint at 6000 K. Each temperature range is listed in the record preceding the corresponding coefficients. For condensed species, the temperature ranges and breakpoints are set according to the data and accuracy of the fits.

Using the Coefficients to Obtain Thermodynamic Functions

The NASA Glenn database can be used to obtain listings of thermodynamic functions, either interactively online with the Properties From Coefficients (PFC) computer program or by use of the Coefficients and Properties (CAP) computer program (Zehe et al., 2001).

The PFC interactive program provides a Periodic Table of the Elements from which the user selects constituent atoms for the species to be tabulated. PFC presents a list of all species in the database containing those elements. The user selects the species of interest and the temperature schedule to be used. PFC lists the current NASA coefficients for those species and uses them to create a table of $C_p^o(T)$, $H^o(T) - H^o(298.15)$, $S^o(T)$, $-[G^o(T) H^{o}(T)]/T$, $H^{o}(T)$, $\Delta H_{f}^{o}(T)$, and log K(T) at each temperature in the schedule. Data are also listed for 0 K, 298.15 K, and for all phase changes within the temperature schedule. PFC can be accessed directly at http:///cea.grc.nasa.gov or from the CEA Web site http://www.grc.nasa.gov/WWW/CEAWeb/ with the selection "Get Properties from NASA Coefficients (PFC)."

The CAP program allows users to tabulate thermodynamic functions from the NASA Glenn coefficients without being connected to the Internet. Thermodynamic functions may be tabulated in SI units, in chemical units (calories and kelvin), or in "engineering" units (Btu/lb-mol and Btu/lb-mol-oR). An option allows the user to generate a file listing temperatures and thermodynamic functions in column format for easy plotting. The program is described in NASA/TP—2001-210959 (Zehe et al., 2001). CAP and the NASA Glenn database are available via a request form at the CEA Web site http://www.grc.nasa.gov/WWW/CEAWeb/.

Appendix B Thermodynamic Properties at 0 and 298.15 K

This appendix contains three tables summarizing the properties of the species in thermo.inp (app. D) at 0 and 298.15 K. Table B1 is for all gaseous species that have coefficients including those used in the NASA program CEA (Chemical Equilibrium with Applications) for reactants-only species. Table B2 lists data for all condensed species. Table B3 summarizes information for all the reactants-only species whether or not they have coefficients.

For cryogenic liquids in this last table, assigned enthalpies $H^o(T)$ are given at their boiling points rather than 298.15 K. For more details on assigned enthalpies see the section "Assigned Enthalpy Values."

Appendix C

Format for Thermodynamic Data Coefficients

This appendix explains the format for data contained in the file thermo.inp (app. D). Equations (1) to (3) are repeated here for convenience:

$$C_{p}^{o}(T)/R = a_{1}T^{-2} + a_{2}T^{-1} + a_{3} + a_{4}T + a_{5}T^{2} + a_{6}T^{3} + a_{7}T^{4}$$
(1)

$$H^{0}(T)/RT = -a_{1}T^{-2} + a_{2}\ln T/T + a_{3} + a_{4}T/2 + a_{5}T^{2}/3 + a_{6}T^{3}/4 + a_{7}T^{4}/5 + b_{1}/T$$
(2)

$$S^{0}(T)/R = -a_{1}T^{2}/2 - a_{2}T^{-1} + a_{3}lnT + a_{4}T + a_{5}T^{2}/2 + a_{6}T^{3}/3 + a_{7}T^{4}/4 + b_{7}$$
(3)

	[always -2, -1, 0, 1, 2, 3, 4; see eq. (1)]		
	$H^{o}(298.15) - H^{o}(0)$ J/mol, if available	F15.3	66 to 80
4	First five coefficients for $C_p^o(T)/R$, eq. (1)	5D16.9	1 to 80
5	Last two coefficients for $C_p^o(T)/R$, eq. (1)	2D16.9	1 to 32
	Integration constants b_1 and b_2 , eqs. (2) and (3)	2D16.9	49 to 80
-	Repeat 3, 4, and 5 for each interval		

^a Condensed phases are numbered in increasing order by temperature.

For example, the following data are for condensed titanium nitride:

TiN(cr) Chase, 1998 pp1612-4. 2 j 6/68 TI 1.00N 1.00 0.00 0.00 0.00 1 61.87374 -337648.800 3 3 800.0007 -2.0 -1.0 0.0 1.0 2.0 3.0 4.0 0.0 4 $-5.479117220D + 05 \ 9.328691110D + 03 - 6.386263890D + 01 \ 2.429925456D - 01 - 4.304234520D - 04 \ 2.429925450D - 01 - 4.304234520D - 04 \ 2.429925450D - 01 - 4.30423450D - 01 - 4.304250D - 01 - 4.30425$ 5 3.792645100D-07-1.317412256D-10 -8.424256140D+04 3.392988560D+02 6 800.000 3220.0007 -2.0 -1.0 0.0 1.0 2.0 3.0 4.0 0.0 5487.000 7 -3.656247060D+05 1.265730431D+03 3.831711190D+00 1.632900455D-03-1.062786626D-07 7 8 1.310931390D-11-5.770548410D-16 -5.027654400D+04-1.652632899D+01 9 9 Chase, 1998 pp1612-4. 1.00N 1.00 0.00 0.00 0.00 2 61.8737 6000.0007 -2.0 -1.0 0.0 1.0 2.0 3.0 4.0 0.0 10 10 1 j 6/68 TI 1.00N 61.87374 -337648.800 11 3220.000 5487.000 11 $0.000000000D + 00 \ 0.00000000D + 00 \ 7.548249987D + 00 \ 0.0000000D + 00 \ 0.0000000D + 00$ 12 12 0.00000000D+00 0.0000000D+00 -3.626039860D+04-3.958296649D+01 13

Appendix C (concluded)

There are two sets of data: one for the crystal and one for the liquid. We focus first on the crystalline phase (records 1 to 8): record 1 lists the name as TiN(cr) and tells us that the data for this phase originated from Chase (1998), pp. 1612–1614. Record 2 gives the following information:

TABLE C2.—EXPLANATION OF SECOND RECORD FOR TIN(cr) DATA

Columns	Contents	Explanation
2	2	Number of intervals covered by the data
4 to 9	j 6/68	Internal NASA reference code (see app. D)
11 to 26	TI 1.00N 1.00	Molecular formula [unused places (11 to 50)
		filled with blanks and zeros]
52	1	(First) condensed phase
58 to 65	61.87374	Molecular weight
70 to 80	-337648.800	$\Delta_f H^o$ (298.15) in J/mol

Records 3 to 5 cover the temperature interval 200 to 800 K. The single digit "7" after the temperature range says that $C_p^o(T)/R$ is described by seven coefficients in each interval. The next eight 5-place fields on record 3 list the temperature exponents in the empirical equation for $C_p^o(T)/R$ used in this temperature interval. The last entry on record 3 contains a value of 5487.00 J/mol for $H^o(298.15) - H^o(0)$. This field will contain the number 0.0000 if $H^o(298.15) - H^o(0)$ is not available. Records 4 to 5 contain the coefficients a_1 through a_7 , b_1 , and b_2 for TiN(cr) for the temperature range 200 to 800 K; records 7 to 8 contain these coefficients for the temperature range 800 to 3220 K. Both intervals use equation (1) to describe $C_p^o(T)/R$.

Immediately following the TiN(cr) data block are data for the liquid. The temperature range 3220 K (melting point) to 6000 K is covered by one set of coefficients, again with seven terms for $C_p^o(T)/R$ and again in the form of equation (1). The zero values listed for all constants except a_3 indicate that the heat capacity is a constant, and in accordance with equation (1), $C_p^o(T)/R = 7.548249987$.

Appendix D Listing of NASA Glenn Thermodynamic Data Coefficients

The remainder of this appendix is a listing of the data file "thermo.inp," which is the subject of this report. The initial lines that start with an exclamation point are comments. See the text and Appendix C for a further explanation of these data.

Equilibrium with Applications).	This library, containing data	for over 2000 solid, lie	nn computer program CEA (Chemical quid, and gaseous chemical species for r codes as well. The data are expressed

This report documents the library of thermodynamic data used with the NASA Glenn computer program CEA (Chemical Equilibrium with Applications). This library, containing data for over 2000 solid, liquid, and gaseous chemical species for temperatures ranging from 200 to 20 000 K, is available for use with other computer codes as well. The data are expressed as least-squares coefficients to a seven-term functional form for $C_p^o(T)/R$ with integration constants for $H^o(T)/RT$ and $S^o(T)/R$. The NASA Glenn computer program PAC (Properties and Coefficients) was used to calculate thermodynamic functions and to generate the least-squares coefficients. PAC input was taken from a variety of sources. A complete listing of the database is given along with a summary of thermodynamic properties at 0 and 298.15 K.
